CEN 5011 – Advanced Software Engineering

Catalog Description
This course deals with the design of large scale computer programs. Included are topics dealing with planning, design, implementation, validation, metrics, and the management of such software projects. (3 credits)

Prerequisite
Knowledge of a data structure course (e.g., COP 3530), Familiarity with at least two high-level programming languages (e.g., C++ and Java) and the foundations of computing, Familiarity with the basic concepts of software engineering, including software process, requirements analysis, design, coding, and testing.

Type
Required for MSCS
Can be an Elective for MSIT, MSTN, and Ph.D. students

Course Objectives
This course provides a comprehensive coverage of software development processes and well-known methods for system requirements analysis, design, implementation, and testing. Essential software management methods will also be introduced. Students will be involved in a semester long team project, which requires the application of various management and development methods covered in the class. Students will gain real experience in developing large software systems, which are extremely useful and helpful for future employment in software industry.

Topics
Essential concepts of software engineering
Software process models
Software management techniques
Software Analysis methods
Software design methods
Software testing techniques
Advanced topics in software engineering
